Rexnord Addax Composite Cooling Tower Coupling

Cooling Tower Coupling Solutions

Rexnord pioneered and introduced the first advanced composite couplings to the cooling tower industry in 1987. With over 50,000 Rexnord Addax composite couplings installed on every continent around the world over the past 25 years, Rexnord has the most experience of any composite cooling tower manufacturer.

The Rexnord Addax Composite Cooling Tower Coupling delivers the best value for the cooling tower industry by providing excellent features such as:

- Corrosion resistance
- High-misalignment capacity
- Excellent fatigue resistance
- Low weight
- Ease of installation

Choose a Rexnord Addax Composite Coupling as your cooling tower coupling if you are currently using a steel coupling or an alternative composite coupling.

Service & Support

Rexnord is the largest coupling manufacturer in the world and has the most comprehensive global sales and customer service team in the industry. Rexnord associates are experts in cooling tower coupling applications and are available to assist you 24/7 if an emergency arises.

Lead Time

Virtually every cooling tower coupling installation has unique coupling dimensions, therefore all Rexnord Addax coupling assemblies are "made to order" per customersupplied specifications. Even though each Rexnord Addax coupling is custom-made, Rexnord provides the absolute best standard lead time in the cooling tower industry — two weeks after receipt of order. As an added benefit, Rexnord offers an exclusive emergency expediting option that includes:

- · Same day shipment
- · Three-day shipments
- Five-day shipments

Quality

Our associates are continually improving our products by applying *Lean Manufacturing* and *Six Sigma* methodology to add increased value to our products. Upon request, a certificate of material, certificate of balance and certificate of conformity can be provided for every Rexnord Addax coupling.

Price

The Rexnord Addax Composite Cooling Tower Coupling is the most inexpensive product of its kind, while providing the most comprehensive list of product features and benefits. Combine the price and product features with Rexnord's dedicated associates who provide an unprecedented level of service and support, and you will agree that the Rexnord Addax Coupling delivers the best value.

Why choose a Rexnord Addax Composite Cooling Tower Coupling over the alternatives?

Features, Functions, Benefits of Rexnord Addax Cooling Tower Coupling								
Features	Functions	Benefits						
Low weight	Reduced mass Reduced bearing loads Reduced inertia	Simplify installation Increase bearing life Reduce vibration						
Corrosion resistance	Chemical attack resistance	Extend service life Reduce maintenance Increase safety Achieve low cost of ownership						
Low coefficient of thermal expansion	Dimensional stability	Reduce vibration Reduce stresses Increase operating range						
Continuous fiber composite spacer flange	Infinite fatigue life	Achieve low cost of ownership						
Unitized flex element	Elimination of fretting infinite fatigue life simplified installation	Achieve low cost of ownership Prolong service life Reduce maintenance Increase safety						
High-misalignment capacity	Reduced equipment stress Increased life	Make installation easier Reduce ownership costs						
High strength to weight ratio	Increased stiffness Higher critical speed	Eliminate harmonics Eliminate steady bearings						

Rexnord Addax Composite Center Section

The advanced composite, full-floating center section weighs less than 25% of a comparable steel spacer. But don't be fooled by the lighter weight. Rexnord Addax advanced composites are heavyweights when it comes to performance, due to their rugged, corrosion-resistant design. With almost twice the critical speed of metals, and up to an 80% reduction in overhung bearing loads, Rexnord Addax composite couplings reduce vibration and extend bearing life. Installation is made easier because there is no need for a crane to install most Rexnord Addax advanced composite coupling systems. Most cooling tower coupling assemblies weigh less than 100 pounds, so maintenance personnel can easily handle them.

The specific modulus of the composite material is 3.5 to 5 times that of steel alloys. This allows the composite spacers to span almost twice the distance of a comparable metal spacer without the need for intermediate bearings. The lower density and higher specific stiffness of composite materials make it practical to use larger cylinder diameters than would be feasible with steel.

A single-length, 20-foot long composite drive shaft from a Rexnord Addax coupling may weigh 100 pounds while the steel counterpart would weigh about 500 pounds and be in two sections. Elimination of steady bearings means drastically reduced maintenance requirements, at lower cost of ownership and increased reliability.

Standard corrosion resistance exceeds that of 316ss; or Rexnord Addax associates can formulate corrosion resistance for specific conditions. Additional ultraviolet light protection is provided by a carbon black additive.

Addax Composite Coupling

Rexnord Addax Patented Composite Flexible Element

This patented Rexnord Addax flexible element was developed to withstand harsh conditions and high-misalignment problems found in cooling towers. This flexible element is a unitized disc constructed of advanced composite material and stainless steel bushings. All flex elements are encapsulated in urethane for ease of handling,

High-strength composite
 appearance, and to prevent fretting and corrosion.

One-degree misalignment

Designed for severe conditions

The exceptional physical and mechanical properties of continuous fiber provides high-misalignment capacity and long service life. Rexnord Addax flexible elements provide infinite fatigue life and simplified installation.

- per flexible elementExceptional service life
- No fretting and corrosion effects

Fretting and stress crack corrosion — the leading contributors to metal disc pack failure — are completely eliminated along with the multitude of parts required for assembly. Maintenance costs are dramatically reduced and installation is greatly simplified. Rexnord Addax flexible elements provide years of trouble-free operation, even under the most demanding conditions.

Rexnord Addax elements are offered in a number of sizes with different torque ratings. Each torque rating is based on static and dynamic tests to provide an infinite fatigue life at rated torque and misalignment.

The flexible element is the only component of the coupling system that experiences alternating loading in which fatigue becomes a factor. The strength of graphite/epoxy remains well over 100,000 psi through infinite cycles. Therefore, the Rexnord Addax flexible element has theoretical infinite fatigue life under rated operating conditions.

Rexnord Addax Patented Continuous Fiber Composite Flange

The Rexnord Addax coupling flange is an integral component of the Rexnord Addax coupling. This patented component transfers torque from the flexible element to the long span composite tube. It is a low-mass, all-composite structure fabricated from continuous fiber material. There is no metal in it at all. The fiber angle path has been optimized for carrying torque and minimizing stress through the flange. This design offers supreme fatigue strength for cooling tower operation. It also offers extraordinary corrosion resistance in a chlorine-rich cooling tower environment.

One of the design features is a high-fiber-volume composite reinforcing ring (cross hatched area) designed integral into the flange area. This ring provides additional strength and stiffness in the bolt joint area. This strength in the flange provides the highest integrity for the bolt circle attaching and centering the flexible element.

Other manufacturers fabricate this flange from random fiber glass and do not have the fatigue strength of the Addax coupling flange. A random fiber flange does not have the reinforcing ring and is prone to fatigue failure in the grueling cooling tower duty applications. The Rexnord Addax coupling flange is continuous fiber and fatigue-tested to demonstrate superior strength.

Coupling Models and Dimensions

Specification

Rexnord Addax Coupling

Standard construction consists of a flanged composite spacer, patented composite flexible elements, 316 Stainless Steel hubs and 316 Stainless Steel hardware. K-500 Monel hardware is available upon request to suit corrosive environments.

Standard Balance

All couplings are dynamically balanced to meet ANSI/AGMA 9000-C90 (R96), Class 9 specifications.

Models: 485.425, 650.625, 650.825, 850.825, 850.1025, 850.1275

All dimensional values are subject to change without notice.
F=Fiberglass; A=Amalgamation; R=Standard Carbon Fiber; X=Special Carbon Fiber.
850 Series couplings may use either of two standard hub styles.
The standard weight and WR² values are at minimum DBSE and standard minimum bore for a complete assembly. To determine the total weight or inertia, subtract the minimum DBSE from the total DBSE required and multiply that value times the WT and/or WR² change per length, then add that calculated WT or WR² to the minimum DBSE values. Values may vary slightly depending on the actual bore and key size.

Addax Cooling Tower Brake

The Addax Cooling Tower Brake is a mechanical, manually-actuated caliper disc brake for stopping, holding and locking out cooling tower fans. It easily adapts to the motor hub of the Addax Composite Coupling.

Safety

- Simply engage the Addax Cooling Tower Brake to safely stop the fan
- No need for ropes, 2 x 4s or lassoing the fan
- · Capable of being locked out according to safety standards for lockout/tagout
- A more reliable means for controlling the potential for fan free-wheeling
- Allows employees to be in direct control of fan free-wheeling during maintenance activities
- All actuation done outside of guards

Protection from windmilling

- In case of high winds, the fan can be locked down in seconds
- Time and expense saved in preparing for plant lock-down
- No more fan or stack damage

Engineering Data

Driveshaft Vibration Caused by Blade Pass Frequency (BPF)

Lateral Natural Frequency (LNF) relates to beam stiffness and mass of the composite coupling. All beams have a natural frequency. The Rexnord Addax driveshaft is a long, slender beam that has an LNF commonly referred to as critical speed. Critical speed of the shaft is calculated in SelectC 2007 and is supplied to our customers. Blade pass frequency (BPF) is the number of blades multiplied by the fan speed. Fan blades in a cooling tower induce a forcing frequency caused by pressure pulsations on adjacent components including the driveshaft.

Blade pass vibration is caused by pressure pulsations on the driveshaft when the shaft's natural frequency is coincident with the fan BPF. When the driveshaft is experiencing a blade pass harmonic, sometimes it can be seen bouncing out of plane. This shaft vibration usually manifests itself in the motor and gearbox. Shaft natural frequency and BPF must be designed 8% away to have assurance there is no overlap. Rexnord Addax shafts exhibit minimal vibration contributing to the overall spectrum. Additionally, gear mesh frequency can be heard resonating from the driveshaft, however this is typically at a much higher frequency magnitude than BPF.

The Cooling Technology Institute (CTI) recommends a 1.15 factor — critical speed over maximum operating speed. Prior to 2011, CTI recommended a 1.30 safety margin. The 1.30 factor was established before composite shafts, when only steel driveshafts were available. Steel shafting is massive, deflects from thermal growth, less predictable and potentially dangerous when approaching critical speed. Composite shafts are less than 1/3 the mass of steel and dimensionally stable. As composite shafts offer 1/3 less mass, the deflection magnitude is significantly less than steel and safe when approaching critical speed. Rigorous testing has proven that a 1.3 margin is not required for composite shafting and CTI dropped their recommendation to a 1.15 margin. Each Addax shaft size and material type is tested. Manufacturing variability accounts for less than $\pm 3\%$ of the variability in the shaft's LNF. It is not recommended to use a 1.15 safety factor when purchasing shafts from other manufacturers, due to possible excessive manufacturing variability in the shaft's LNF. These facts demonstrate that a 15% safety margin over operating speed is adequate for safe driveshaft operation.

Why Choose Rexnord?

When it comes to providing highly engineered products that improve productivity and efficiency for industrial applications worldwide, Rexnord is the most reliable in the industry. Commitment to customer satisfaction and superior value extend across every business function.

Delivering Lowest Total Cost of Ownership

The highest quality products are designed to help prevent equipment downtime and increase productivity and dependable operation.

Valuable Expertise

An extensive product offering is accompanied by global sales specialists, customer service and maintenance support teams, available anytime.

Solutions to Enhance Ease of Doing Business

Commitment to operational excellence ensures the right products at the right place at the right time.

Rexnord Corporation

Rexnord is a growth-oriented, multi-platform industrial company with leading market shares and highly trusted brands that serve a diverse array of global end markets.

Process and Motion Control

The Rexnord Process and Motion Control platform designs, manufactures, markets and services specified, highly engineered mechanical components used within complex systems where our customers' reliability requirements and the cost of failure or downtime are extremely high.

Water Management

The Rexnord Water Management platform designs, procures, manufactures and markets products that provide and enhance water quality, safety, flow control and conservation.
