

Electromagnetic multiple-disc clutch Type 522

Electromagnetic multiple-disc clutch - Type 522

Characteristics and features

- suitable for torque transmission with increasing differential speed between the drive elements
- high torque transfer despite compact dimensions
- designs up to 3800 Nm possible
- high switching frequency due to optimized heat dissipation
- negligible wear due to special friction lining
- oil running or dry running
- suitable for applications in harsh environments
- reduced shift speeds due to adapted control

Mönninghoff power transmission represents an infinite variant diversity that is applied by all areas of modern mechanical engineering.

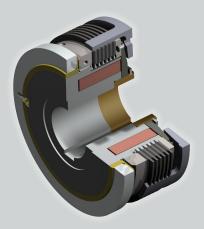

Our technologies are mostly designed to operate under extreme conditions. We offer high precision products for medical robotics, fail-proof security for aerospace technology or synchronization soultions for the packaging or printing industry.

We thus address customers who have the highest standards for their own machines or systems. To them, we can offer highly complex, application-specific solutions.

Electromagnetic multiple-disc clutch - Type 522

Match code

Mönninghoff multiple-disc clutches are indicated by the following match code:

522 . A . B . C

- A clutch size
- **B** operating mode
- C length of drive ring

Other individual characteristics:

- voltage
- bore size with keyway

According to these characteristics, we design individual solutions concerning transmitted torque, engaging behavior or rotation speed.

Our engineers can assist with finding an application-specific clutch at any time. Together, we can develop individual and innovative solutions for extreme operating conditions.

Ordering example

Mönninghoff electromagnetic multiple-disc clutch Type 522.21.1.1

Operating mode dry running Voltage 24 Vdc

Bore size d 40mm H7, keyway acc to. DIN 6885/1

Electromagnetic multiple-disc clutch - Type 522

Clutch size

The selection of the correct size of a Mönninghoff electromagnetic multiple-disc clutch is determined by the requiered torque as well as the shift work.

According to the required torque

$$M_s \ge M_{erf}$$

According to the shift work

$$E_h \leq Q_h$$

The clutch must transfer load and acceleration torque (M_L ; M_b). The required safety is obtained by using a corresponding safety factor (K).

$$M_{erf} = (M_b \pm M_L) \cdot K$$

$$M_b = \frac{I \cdot \Delta n}{9,55 \cdot t} \quad [Nm]$$

$$Q_h = Q \cdot k_1 \cdot k_2 \quad [Nm]$$

$$E_h = \frac{I \cdot (\Delta n)^2 \cdot Z}{182.4} \quad [Nm]$$

If the load and acceleration torque cannot be determined, the required torque can be derived from the driving power, taking the required safety into cosideration.

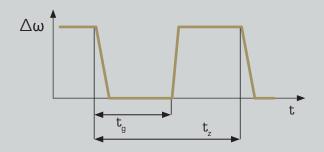

$$M_{erf} = 9550 \cdot \frac{P}{n} \cdot K \text{ [Nm]}$$

${\sf M}_{\sf erf}$	= required torque	Р	= driving power [kW]
M_{b}	= acceleration torque	K	= safety factor [1,2 to 4]
$M_{\mathtt{s}}$	= shift torque	1	= moment of inertia [kgm²]
M_{\scriptscriptstyleL}	= output load torque	Z	= number of shift operations per hour
n	= speed of rotations [min ⁻¹]	Q	= amount of heat
Δn	= differential speed of rotations [min ⁻¹]	E_h	= shift energy per hour [Nm]
k_1	= correction factor	t	= acceleration time [sec]
k_2	= correction factor		based on t ₁

Electromagnetic multiple-disc clutch - Type 522

Determination of shift work

The energy that is lost in the clutch depends on the shift curve and the shift frequency. The correction factors for the permissible shift work per hour Q_h can be derived from the tables and graphs.

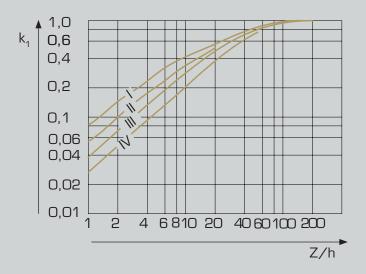

Course of a shift cycle

t_a = time during which the clutch is closed

t_z = total cycle time

 $\Delta \omega$ = differential angular velocity

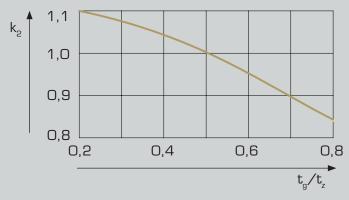

Correction factor $\boldsymbol{k}_{\scriptscriptstyle 1}$ as a function of the shift frequency per hour

I valid for 522.32 - 522.33

II valid for 522.24 - 522.28

III valid for 522.21 - 522.22

IV valid for 522.16

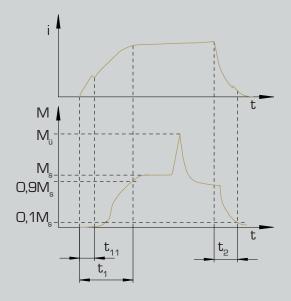

Correction factor $\rm k_{\rm 2}$ as function $\rm t_{\rm g}/t_{\rm z}$

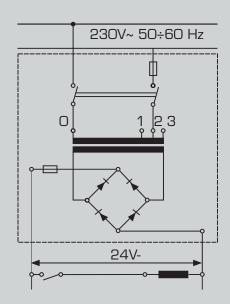

Size			16	21	22	24	26	28	31	32	33
Amount of heat Q	dry running: bad ventilation oil lubrication: oil spray	10 ⁶ [Nm/h]	Nm/h] 0,43	0,62	0,86	1,2	1,5	1,9	2,3	2,9	4,4
	dry running: good ventilation oil lubrication: oil pray		0,49	0,71	0,99	1,38	1,73	2,19	2,65	3,34	5,06

Electromagnetic multiple-disc clutch - Type 522

Switching

Electromagnetic clutches are inductances. Engagement and disengagement are subject to the laws of induction, i. e. the induction current increases according to an e-function.

Shift speeds

Shift diagram: normal shifting

- ullet t_1 and t_2 can be electrically influenced by taking appropriate measures
- it is advisable to use direct current for shifting
- when determining the size, the engage time is considered to be approximately 30% of the total acceleration time, which normally results in additional safety

Technical data

Size		16	21	22	24	26	28	31	32	
shift speeds acc. to VDE 0580:2011-11	t ₁ [msec]	120/170	140/200	200/280	310/400	400/480	480/550	600/750	800/1000	normal excitation for oil and dry
	t ₂	30/35	30/40	35/50	40/60	40/60	50/80	50/80	60/100	lubrication

i = induction current

t₁ = engage time

 M_{ij} = torque to be transferred / static torque

 t_2 = disengage time

 M_s = torque to be shifted

 t_{11} = response delay

Electromagnetic multiple-disc clutch - Type 522

Operating mode

Mönninghoff electromagnet multiple-disc clutches are avaible in two operating modes

- Type 522._.1._ for dry running
- Type 522._.2._ for oil running

To reduce the engage time, fast excitation can be achieved by applying up to three times the rated voltage. When oil is used and particularly if the oil is cooled internally, the rise time can be affected considerably and may double or triple (observe oil instructions).

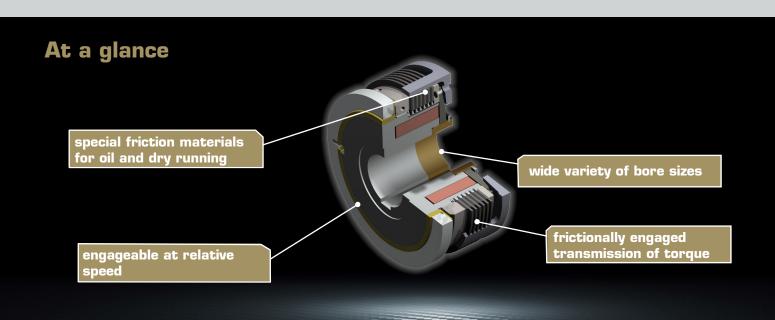

Use oil with a viscosity up to 25 x 10^6 m²·s⁻¹ by 50 °C (3°E / 50 °C).

Voltage

- standard voltage is 24 Vdc dirrect current
- special voltages as a example 48 Vdc on request

Technical characteristics

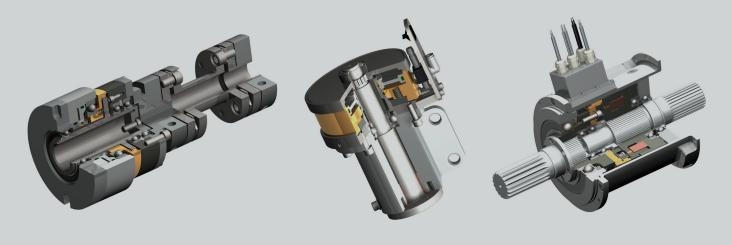

- the positioning of the discs outside the magnetic field permits the use of special friction materials for both oil and dry lubrication
- the expanding springs of the outside discs open the disc stack when the coil is switched off. Consequently, friction and wear in neutral are negligible
- the adjustment of the air gap is easily accessible

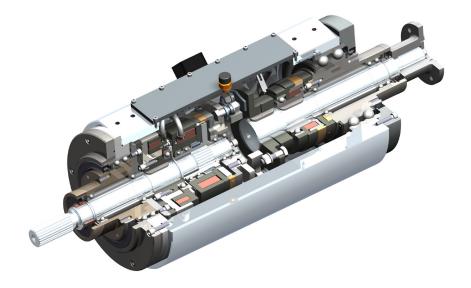

System solutions

You need more?

Mönninghoff clutches can be combined with a variety of many other power transmission elements. Such complex high-tech systems can solve any application-specific tasks and can fulfill any customer-specific wishes.

In many cases, a combination of different drive elements is needed to solve the applications particular problems and difficulties. Being not just supplier but technological partner to our customers, our extensive engineering is part of extraordinary and challenging power transmission projects.

Driven by excellence

Why Mönninghoff

- intensive dialog with our customers' engineers
- decades of experience and competence
- deep understanding for all areas of mechanical engineering
- highly modern and flexible machine park
- enthusiasm for quality
- flexibility, inventiveness and communication skills of our employees
- commitment to Germany and Bochum as industrial location

Helps you find a customer-specific power transmission solution for extraordinary circumstances.

For the competent processing and smooth handling of your orders and delivery dates.

Feels committed to protect and preserve the high value of your machine and to secure its availability.
