RG

Technology Made in Italy

Since 1955 Varvel has been making speed reducers and variators for light industry applications. Reliable partner in power transmission equipment offers also customized solutions always according to a socially responsible company values. Modularity and flexibility lead Varvel products by a unique kit form, common to all gearbox series. This feature allows distributors an easier job to set up required products in few minutes.

RG

LOW BACKLASH PLANETARY GEARBOXES

Coupling to brushless, DC and IEC/NEMA standard motors

Planetary gearboxes RG

Description

One-piece body
of hardened and tempered steel
and modular design
of input and output flanges

Gears

- one-piece broached ring gear
- sun and planet gears of alloy steel, case-hardened and skiving finished

Bearings

- 2Z ball types on input shaft
- 2RS ball types on output shaft
- needle types between planet gear and planet shaft

Planet carrier

- overhanging with high stiffness

Input
Servo, DC, IEC and NEMA
motor adapters
with clamping clutch

Output
flanges fitted
on output bearing spigot

Temperature
Bearings -40 / +100 °C
-40 / +212 °F
Ambient -15 / +40 °C
+5 / +104 °F

The planetary speed reducers, Series RG, are designed as one and two stage versions, with hardened and tempered steel housing and broached internal gear.

Manufactured to latest ISO engineering design specifications is checked by computer-aided structural analysis for deflection and stress distribution.

Significant strains caused by the effects of both torque and external loads do not stress the monolithic housing, substantially improving the sealed surfaces.

The planetary speed reducers RG are made of alloyed steel gearing, hardened and tempered; the planetary gear shafts of tempered steel.

Motor coupling options are available with clamping clutch, input flange and bush adapters.

Single-setup machining on state-of-the-art CNC production lines, the most recent calculation techniques and process controls give superior operational reliability, maximum output torques, high overhung and thrust load capacity, and long working life-time.

Planetary gearboxes RG

Description

GENERAL SPECIFICATIONS

C_t [Nm / arcmin]	Torsional rigidity
F_{r2} [N]	Catalogue radial load (output)
F_{a2} [N]	Catalogue axial load (output)
F_s	Shock factor
i	Reduction ratio (finite values)
J_1 [kgcm ²]	Moment of inertia at gearbox input shaft
T_{2acc} [Nm]	Gearbox max. output acceleration torque (S5 operation - max. 1000 cycles per hour)
T_{2ISO} [Nm]	Gearbox nominal output torque according to ISO 6336 (S1 continuous operation)
T_{2max} [Nm]	Gearbox emergency output torque (max. 1000 times in gearbox life)
n_1 [min ⁻¹]	Input speed
n_{1max} [min ⁻¹]	Max. input speed
P [kg]	Weight (average reduction ratio)
η	Efficiency
j	Angular backlash

Duty cycle - Operation

Duty cycle

The correct investigation of actual duty cycle is the basic rule in planetary gearbox selection. An operative and basic duty cycle can be pictured as follows: :

where:

- $n_{2\ max}$ [rpm] - Max. speed
- $n_{2\ mid}$ [rpm] - Average speed
- t_1 [s] - Acceleration time
- t_2 [s] - Operation time
- t_3 [s] - Deceleration time
- t_4 [s] - Pause time
- $T_{2\ max}$ [Nm] - Max. acceleration torque
- $T_{2\ mid}$ [Nm] - Operation torque
- $T_{2\ dec}$ [Nm] - Deceleration torque

Operation

The operative duty cycle fixed, there are two operation ways:

- **Continuous (S1)** - if $S_p > 60\%$
 - or $S_t > 20$ minutes
- otherwise
- **Intermittent (S5)** - if $S_p < 60\%$
 - and $S_t < 20$ minutes

where:

- S_p - per cent operation time
- S_t - operation time
- min - minutes

$$S_p = \frac{t_1 + t_2 + t_3 + t_4}{t_{tot}} * 100 \quad [\%]$$

$$S_t = \frac{t_1 + t_2 + t_3 + t_4}{60} \quad [\text{min}]$$

Planetary gearboxes RG

Gearbox selection

Gearbox selection

Gearbox selection is made according to the following formulas for Continuous or Intermittent operation.

S1 - Continuous operation

for $S_p > 60\%$ or $S_t > 20$ min

$$T_{2\text{ nom}} = \frac{T_{1\text{ nom}} * i * \mu}{0.65}$$

$$T_{2\text{ nom}} > T_{2\text{ ISO}}$$

$$n_{2\text{ eqv}} = n_{2\text{ nom}}$$

where:

$T_{2\text{ nom}}$ [Nm] = Gearbox nominal torque
 $T_{1\text{ nom}}$ [Nm] = Motor nominal torque
 $T_{2\text{ ISO}}$ [Nm] = Gearbox nominal torque according to ISO
 $n_{2\text{ nom}}$ [rpm] = Output nominal speed
 $n_{2\text{ eqv}}$ [rpm] = Output average speed

S5 - Intermittent operation

for $S_p < 60\%$ or $S_t < 20$ min

$$T_{2\text{ acc}} \geq T_{1\text{ acc}} * i * f_s * \mu$$

$$Z_h \geq \frac{3600}{t_1 + t_2 + t_3 + t_4}$$

$$T_{2\text{ eqv}} = \sqrt[3]{\frac{T_{2\text{ max } 1}^3 * n_{2\text{ mid } 1} * t_1 + \dots + T_{2\text{ max } n}^3 * n_{2\text{ mid } n} * t_n}{t_1 * n_{2\text{ mid } 1} + \dots + t_n * n_{2\text{ mid } n}}}$$

$$n_{2\text{ eqv}} = \frac{n_{21} * t_1 + \dots + n_{2n} * t_n}{t_1 + \dots + t_n}$$

$n_{2\text{ eqv}}$ [rpm] = Cycle equivalent speed

$n_{2\text{ mid}}$ [Nm] = Average speed

$t_1 \dots t_4$ [s] = Acceleration, operation, deceleration, pause times

where:

$T_{2\text{ acc}}$ [Nm] = Gearbox max. acceleration torque
 $T_{1\text{ acc}}$ [Nm] = Motor max. acceleration torque
 i [...] = Reduction ratio
 f_s [...] = Shock factor (see graph)
 η [...] = Gearbox efficiency
 Z_h [1/h] = Cycle number per hour
 $T_{2\text{ eqv}}$ [Nm] = Equivalent torque, resultant by individual torques of duty cycle
 $T_{2\text{ max}}$ [Nm] = Max. torque
 n_{2n} [rpm] = Cycle speed
 t_n [s] = Cycle times

Shock factor

Shock factor is a service factor that keeps into account rapid motion inversions associated with quick acceleration times. Such overloads must be considered when sizing.

f_s - Shock factor
 Z_h - Cycle numbers per hour

Planetary gearboxes RG

Motor fitting

Step 1

- Remove the protection cap.
- Rotate the gearbox input bush until tightening screw head is aligned with the access hole of the flange.
- Loosen the tightening screw.
- Correctly align the motor shaft to the gearbox.
- Fit the motor vertically.

Step 2

- Apply anti-loosening paste (Loctite 243 or similar) on screw thread.
- Tighten the screws according to table torque values.
- Screw resistance class: recommended 12.9

Screw diameter	[Nm]
	12.9
M4	4.9
M5	9.7
M6	16
M8	40
M10	77

Step 3

- Set torque wrench to measure tightening torque value as shown.
- Tighten clamp screw as listed.

Gearbox type	Screw class 12.9	
	Type	[Nm]
RG 051/052	VC 4.12	4.9
RG 071/072	VC 5.20	9.7
RG 091/092	VC 6.30	16
RG 121/122	VC 8.40	40

- **VC screw type:**
Socket-head screw (Allen screw).

Step 4

- Reset the protection plug.

Abstract of OPERATION AND MAINTENANCE INSTRUCTIONS

(complete manual on www.varvel.com)

Variable speed and reduction gearboxes are not part of the field of application of the Machinery Directive, art.1(2), and they must not be put into service until the machinery into which they are to be incorporated, has been declared in conformity with the provision of art. 4(2), annex II(B) of Machinery Directives 98/37/CEE/22.6.98 and for Italy only, of DL 459/24.7.96.

Installation

Check if the unit to be installed, is properly selected to perform the required function and that its mounting position complies with the order.

The nameplate reports such information.

Check mounting stability to ensure the unit runs without vibrations or overloads.

Running

The unit may be connected for clockwise or counter-clockwise rotation.

The unit must be stopped as soon as defective running or unexpected noise occur, remove the faulty part or return the unit to the factory for checking.

If the faulty part is not replaced, other parts can also be affected, causing more severe damage and making the identification of initial cause more difficult.

Maintenance

Although the units are no-load run tested in the factory before despatch, it is recommended not to run them at maximum load for the first 20-30 running hours to allow the proper running in.

The gearboxes are delivered already filled with long-life synthetic oil and, in case of replacement or topping, do not mix with mineral lubricants.

Handling

When hoisting, use relevant housing locations or eyebolts if provided, or foot or flange holes.

Never hoist on any moving part.

Painting

Carefully protect oil seals, coupling faces and shafts when units are re-painted.

Long-term storage

For storage longer than 3 months, apply anti-oxidants onto shafts and machined surfaces, and protective grease on oil seal lips.

Product's Environmental Management

In conformity with Environmental Certification ISO 14001, we recommend the following to dispose of our products:

- scraped components of the units to be delivered to authorized centres for metal object collection;
- oils and lubricants drained from the units to be delivered to Exhausted Oil Unions;
- packages (pallets, carton boxes, paper, plastic, etc.) to lead into regeneration/recycling circuits as far as possible, by delivering separate waste classes to authorized companies.

unicef

A socially responsible company

To the scope of intensifying our commitment to society, Varvel since 2004 started an ongoing support programme with three non-profit institutions: UNICEF (United Nations Children's Fund), MSF (Médecins sans Frontières) and ANT (National Cancer Association). Environmental respect and protection are also part of Varvel's values and this is why Varvel certified in 2001 its Environmental System to standard UNI EN ISO 14001.
